## ANGIOGENESIS INHIBITORS

### SPECIFICATION

#### 5 Technical Field:

The present invention relates to nonpeptide compounds having RGD mimetic activity and to the synthesis and biological activity of nonpeptide compounds having RGD mimetic activity. More particularly, the present invention relates to 10 nitroaryl based nonpeptide RGD mimetics and to their synthesis and biological activity.

#### Background:

The integrins are a class of extracellular proteins that 15 facilitate cell-cell and cell-matrix adhesion (Cheresh, D.A.; Mecham, R.P. Eds.; Academic Press: New York, 1994; Stromblad, S.; Cheresh, D.A. Chem. Biol. 1996, 3, 881) These important biological targets are membrane bound, heterodimeric glycoproteins made up of an  $\alpha$ -subunit and a smaller  $\beta$ -subunit. 20 The relative affinity and specificity for ligand binding is determined by the unique combination of the different  $\alpha$ - and  $\beta$ - subunits. Of the members of this family of receptors,  $\alpha_{IIb}\beta_3$ ,  $\alpha_5\beta_1$ ,  $\alpha_v\beta_3$ , and  $\alpha_v\beta_5$  are the most studied. A number of known natural ligands to these integrins, such as fibronectin 25 (binds to  $\alpha_5\beta_1$ ), fibrinogen (binds to  $\alpha_{IIb}\beta_3$ ) and vitronectin (binds to  $\alpha_v\beta_3$ ), contain the key peptide sequence Arg-Gly-Asp (RGD) within their native sequence, which is recognized by most integrins. The  $\alpha_{IIb}\beta_3$  integrin was shown to be an excellent target for the inhibition of platelet aggregation 30 and several groups have already disclosed the design and synthesis of potent binders with peptide and nonpeptidal - structures (Ojima et al. Bioorg. Med. Chem., 1995, 337; Engleman et al. Ann. Rep. Med. Chem. 1996, 31, 191).

35 Within the context of angiogenesis, the functions of  $\alpha_v\beta_3$  and  $\alpha_v\beta_5$  have been shown to be vital. Cheresh and coworkers have shown that in vivo inhibition of binding of these

-2-

integrins to their RGD-containing ligands by antibodies or cyclic peptides interferes with angiogenesis and induces tumor regression (Brooks et al. Science 1994 et al. Rosenfeld et al. Cell 1994, 79, 1157). In addition to its relevance to 5 angiogenesis,  $\alpha_v\beta_3$  has also been known to play a role in mediating adhesion of osteoclasts to the bone matrix and in the migration of vascular smooth muscle cells.

Antagonists of  $\alpha_v\beta_3$  are, therefore, envisioned as 10 potential therapeutic agents for the treatment of numerous disease states such as diabetic retinopathy, cancer, osteoporosis and restenosis (Van der Pluijm et al. Bone Mineral Res. 1994, 9, 1021; Helfrich et al. J. Bone Mineral Res. 1992, 7, 335; Horton et al. Exp. Cell Res. 1991, 195, 15 368; Robey et al. Ann. Rep. Med. Chem. 1993, 28, 227; Choi et al. Surgery 1994, 19, 125; Matsuno et al. Circulation 1994, 90, 2203; Hammes et al. Nature Med. 1996, 2, 529; Friedlander et al. Proc. Natl. Acad. Sci., USA 1996, 93, 9764.

20 The first small molecule antagonists of  $\alpha_v\beta_3$  were reported by Kessler et al. (e.g. 1, Figure 1; Gurrath et al. Eur. J. Biochem. 1992, 210, 911; Muller et al. Angew. Chem. Int. Ed. Engl. 1992, 31, 326; Aumailley et al. FEBS Lett. 1991, 291, 50; Pfaff et al. J. Biol. Chem. 1994, 269, 20233; 25 Haubner et al. J. Am. Chem. Soc. 1996, 118, 7461). Subsequently, groups from Dupont-Merck (e.g. 2, Figure 1) and SmithKline Beecham (SKB) (e.g. 3, Figure 1) published their results in the field. In addition, other RGD containing cyclic peptides 4 and 5 (Figure 1) were synthesized and shown 30 to be active by Burgess et al. and Goodman et al. respectively (Bach et al. J. Am. Chem. Soc. 1996, 118, 293; Peishoff et al. J. Med. Chem. 1992, 35, 3962; Burgess et al. J. Med. Chem. 1996, 39, 4520; Tran et al. Bioorg. Med. Chem. Lett. 1997, 7, 997).

35

More recently a number of groups reported their results with high affinity ligands for  $\alpha_v\beta_3$  possessing structures

-3-

significantly deviating from classical peptide frameworks (e.g. 6-9, Figure 2). These structures contain a central scaffold (e.g. benzene, benzodiazepine-type or urea backbone) onto which appendages carrying carboxylate and guanidino groups are attached (Duggan et al. Abstracts of Papers, 211th ACS National Meeting, New Orleans, LA, March 24-28, 1996; American Chemical Society: Washington, DC, 1996, MEDI 234; Keenan et al. J. Med. Chem. 1997, 40, 2289; Corbett et al. Bioorg. Med. Chem. Lett. 1997, 7, 1371; Gadek et al. Abstracts 5 of Papers, 211th ACS National Meeting, New Orleans, LA, March 24-28, 1996; American Chemical Society: Washington, DC, 1996, MEDI 235; Hirschmann et al. J. Am. Chem. Soc. 1996, 115, 10 12550).

15 What is needed are synthetically accessible RGD mimetics which posses stability *in vivo* with high activity and selectivity against various integrin targets. Furthermore, what is needed is an efficient and general method to produce such compounds.

20

Summary of the Invention:

The invention is directed to the design, chemical 25 synthesis and biological evaluation of a series of nitroaryl-based RGD mimetics. More particularly, the invention is directed to compounds which combine a novel nitroaryl system with arylether/ $\alpha$ -aminoacid/guanidine frameworks of the type disclosed in U.S. Patent No. 5,741,796, issued April 21, 1998, 30 incorporated herein by reference, i.e., the "Merck compounds".

One aspect of the invention is directed to an RGD mimetic represented by the following structure:

35

-4-

In the above structure, R<sup>1</sup> is selected from the following radical:

10

Here, **X** is a diradical selected from sulfur, -NH- and oxygen. R<sup>2</sup> is a radical selected from -CO<sub>2</sub>t-Butyl, -CO-Aryl and -SO<sub>2</sub>-Aryl. Preferred **Aryls** include phenyl, 1-naphthyl, and 2-naphthyl. A preferred R<sup>2</sup> radical is -SO<sub>2</sub>-Aryl: A preferred 15 RGD mimetic is represented by the following structure:

15 RGD mimetic is represented by the following structure:

20

Other preferred RGD mimetics are represented by the following structures:

-6-

Another aspect of the invention is directed to a method for producing the above RGD mimetics. Firstly, a nitroaryl precursor is provided having a fluoride group covalently attached to the nitroaryl ring represented by the following 5 structure:

10

In the above structure,  $R_3$  is an acid protecting group. Then, the fluoride group is displaced with a nucleophile having a protected guanidine group using nucleophilic aromatic 15 substitution for producing a protected RGD mimetic. Finally, the protected RGD mimetic is deprotected with an acid for producing the RDG mimetic.

Another aspect of the invention is directed to an RGD 20 mimetic represented by the following structure:

25

30

In the above structure,  $R^2$  is a radical selected from a group consisting of  $-CO_2t\text{-Butyl}$ , and  $-SO_2\text{-Aryl}$ . Preferred Aryls include phenyl, 1-naphthyl, and 2-naphthyl.

The above RGD mimetics were tested against a variety of integrins ( $\alpha_v\beta_3$ ,  $\alpha_{IIb}\beta_3$ , and  $\alpha_v\beta_5$ ) for their ability to inhibit cell adhesion and in order to determine their binding selectivity. Selected compounds were also tested for their ability to inhibit angiogenesis in vivo in the CAM (chick 35 chorioallantoic membrane) assay. All compounds were verified to have inhibitory activity and selectivity against the above targets, consistant with their activity as inhibitors of

angiogenesis.

Another aspect of the invention is directed to a process for differentially inhibiting  $\alpha_{iib}\beta_3$  mediated cell adhesion over  $\alpha_v\beta_3$  mediated cell adhesion. Cells that express  $\alpha_{iib}\beta_3$  are contacted with a solution containing selected RGD mimetics. The solution has a concentration of such RGD mimetics sufficient for inhibiting  $\alpha_{iib}\beta_3$  mediated cell adhesion. As a result,  $\alpha_{iib}\beta_3$  mediated cell adhesion is inhibited at least approximately 100 fold more than  $\alpha_v\beta_3$  mediated cell adhesion. Preferred RGD mimetics employable for this aspect of the invention are as follows:

TFA = trifluoroacetic acid; DMF = dimethylformamide.

30 Figure 11 shows a compilation of data which indicates the effect of nitroaryl ethers on RGD-dependent ligand interaction with integrins. The concentration necessary for half-maximal inhibition of ligand binding (IC<sub>50</sub>) is shown. The peptide 35 GRGDSPK and compound 1 were included for reference. The data have been sorted by IC<sub>50</sub> values (from low to high) on α<sub>v</sub>β<sub>3</sub>. The 'cQ' value shows the activity of the NPE relative to the activity of compound 1. The '>', shows that the IC<sub>50</sub> had not

-11-

been reached at the maximum concentration tested, 10  $\mu\text{M}$ .

Figure 12 shows a compilation of data which indicates the effect of nitroaryl ethers on RGD-dependent cell adhesion to immobilized ligands. The concentration necessary for half-maximal inhibition of ligand binding ( $\text{IC}_{50}$ ) is shown. 25000 cells were allowed to adhere to immobilized ligands in the presence of the nitroaryl ethers as described herein. The concentration resulting in half-maximal inhibition of cell adhesion ( $\text{IC}_{50}$ ) is shown. The data have been sorted by  $\text{IC}_{50}$  (from low to high) on  $\alpha_v\beta_3$  mediated adhesion of M21 cells.

15 Detailed Description:

Example 1: Design, Synthesis and Biological Evaluation of Nonpeptide Integrin Antagonists:

20 In this example we describe the design, chemical synthesis and biological evaluation of a series of nitroaryl-based RGD mimetics. Figure 3 shows the targeted compounds (10-22). Amongst the considerations that led to their design were : (a) the Merck findings pointing to the importance of 25 the guanidine/aryl sulfonamide functionalities (Duggan et al. Abstracts of Papers, 211th ACS National Meeting, New Orleans, LA, March 24-28, 1996; American Chemical Society: Washington, DC, 1996, MED 234); and (b) the facile entry into such structures from o-nitro-arylfluorides as shown in Figure 4.

30 The designed molecules fall within the general structure I (Figure 4) which can be derived by coupling the central nitrofluoroaromatic system II with fragments III (nucleophile) and IV (aminoacid component).

35 For the synthesis of compounds 10-22 (Figure 3), the amino acid derivatives 26, 29a and 29b were required. These intermediates were obtained from L-asparagine (23) as outlined in Figure 5. Thus, conversion of 23 to its Boc derivative

-12-

(24, 88%) under standard conditions was followed by benzyl ester formation ( $\text{Cs}_2\text{CO}_3$ -BnBr) to afford 25 (88% yield). Reduction of the primary amide with  $\text{PhI}(\text{OCOCl})_2$ , furnished derivative 26 in 41% yield. The sulfonamides 29a and 29b were 5 prepared by sulfonylation of the amino group to afford 27a, followed by Hoffmann rearrangement and esterification of the resulting aminoacids (28a and 28b) with isobutylene (Figure 5).

10 Figure 6 summarizes the initial approach to compounds 10-13. Thus, 4-fluoro-o-nitrobenzoic acid (30) was converted to its methyl ester (31, 98%) by treatment with trimethylorthoacetate at 80°C, and thence reacted with  $\text{N}_3(\text{CH}_2)_2\text{OTBS}$  in DMF in the presence of catalytic amounts of 15 TBAF resulting in the formation of compound 32 (73%; yields are unoptimized). Saponification of 32 (LiOH, 99% yield) furnished carboxylic acid 33 which was condensed with building block 26 in the presence of DCC and 4-DMAP to give key intermediate 34 (82% yield). For the synthesis of 10, compound 20 34 was reduced with  $\text{Ph}_3\text{P}$  in the presence of  $\text{H}_2\text{O}$ , to afford amine 35a, together with the rearranged product 35b (80% combined yield) in which the side chain heteratoms have interchanged positions (via an internal nucleophilic attack, see structure 35a). On standing at ambient temperature, 25 primary amine 35a underwent quantitative conversion to primary alcohol 36b. However, it was possible to rapidly manipulate the compound through basic hydrolysis (LiOH) and guanylation (1H-pyrazole-1-carboxamidine•HCl) and obtain the targeted compound 10 albeit in low yield (15% after RP-HPLC 30 purification).

For the synthesis of the sulfonamide compounds 11-13, the common intermediate 34 was deprotected (TFA, 84%) and the liberated amine (37) was reacted with the appropriate sulfonyl 35 chloride to afford compounds 38a (78 %) and 38b (57 %). Reduction of the azide functionality in 38a and 38b with  $\text{Ph}_3\text{P}-\text{H}_2\text{O}$ , again resulted in a mixture of the corresponding primary amine (39a and 39b) and its rearranged primary alcohol (41a

-13-

and 41b) in 80% total yield. Basic hydrolysis of 39a and 39b resulted in the formation of the corresponding carboxylic acids (40a and 40b, 93-99% yield), guanylation of which as described above furnished the desired compounds 11 and 13 (13-5 15% yield) respectively. Similarly, hydrolysis of 41a (LiOH, 96% yield) followed by guanylation furnished compound 12 in low yield, via compound 42a.

The rearrangement observed during the reduction of the 10 side chain azido group led us to explore an alternative strategy for the construction of the targeted nitroaryl ether compounds. According to the new plan, a nucleophilic species containing a fully protected guanidine moiety was to be employed in the displacement of the fluoride from the central 15 nitroaryl system. To this end the nucleophiles 51-56 (Poss et al. Tetrahedron Lett. 1992, 33, 5933; Iwanowicz et al. Synth. Commun. 1993, 23, 1443; Cherkaoui et al. Bull. Soc. Chim. Fr. 1991, 255) were prepared from readily available starting materials and by standard chemistry as outlined in Figure 7. 20 The incorporation of these fragments into the mainframe of the molecule via nucleophilic aromatic substitution, and the synthesis of the final targets are shown in Figure 8 (11, 14-19) and Figure 9 (21 and 22). Thus, the acid chloride 57 (derived from carboxylic acid 30) was coupled with amines 29a 25 and 29b in the presence of Et<sub>3</sub>N to afford amides 58 (98%) and 59 (99%) respectively. Coupling of 58 with nucleophile 51 was effected in the presence of NaH in DMF to afford product 60 in 66% yield. Similarly 63 was obtained by coupling 59 with 51 (69% yield). The amino compounds 61 and 64 were obtained from 30 58 and 59 in 73 and 99% yield respectively, by reaction with amine 53 in DMF at ambient temperature. Thioether 62 was obtained by exposure of 58 to thiol 54 and NaH (DMF, 25°C, 23% yield). Treatment of compounds 60-64 with TFA in CH<sub>2</sub>Cl<sub>2</sub> at room temperature resulted in concomitant deprotection of both 35 the guanidine and carboxyl groups in excellent yield (90-99%, after RP-HPLC purification). The piperazine compounds 16 and 19 were prepared in a similar fashion from 58 and 59 respectively by first displacing the fluoride with nucleophile

-14-

52, followed by TFA-induced deprotection of the resulting derivatives 65 and 66 as summarized in Figure 8.

The synthesis of compounds 20 and 21 is shown in Figure 5 9. Thus, reaction of 58 with 55 in the presence of Et<sub>3</sub>N at 25°C in DMF resulted in the formation of compound 67 (92% yield) which was exposed to TFA:CH<sub>2</sub>Cl<sub>2</sub> (1:1) at 25°C to afford targeted benzimidazole 20 (97% yield). In a similar fashion, compound 21 was prepared via the intermediacy of 68 by 10 reaction of 58 with 56 (Et<sub>3</sub>N, DMF, 25°C, 94%), followed by deprotection (83% after RP-HPLC purification).

Finally, the preparation of compound 22 is shown in Figure 10. Thus, key intermediate 57 was reacted with ammonia 15 in DMF to afford nitroaniline 69 in 93% yield. Reduction of 69 with H<sub>2</sub> in the presence of 10% Pd/C catalyst in MeOH led to 1,2 diamine 70 (90%), which reacted with phenylisothiocyanate in EtOH to afford thiourea 71 (69% yield). Treatment of 71 with HgCl<sub>2</sub> and Et<sub>3</sub>N in DMF at ambient temperature gave 20 guanidine 72 in 81% yield. Cleavage of the tert-butyl ester in 72 with TFA in CH<sub>2</sub>Cl<sub>2</sub> then led to the targeted compound 22 (80% yield, after RP-HPLC purification).

## EXPERIMENTAL PROTOCOLS

### General:

All reactions were carried out under an argon atmosphere with dry, freshly distilled solvents under anhydrous conditions, unless otherwise noted. Tetrahydrofuran (THF) and 30 diethyl ether (ether) were distilled from sodium-benzophenone, and methylene chloride (CH<sub>2</sub>Cl<sub>2</sub>), benzene (PhH), and toluene from calcium hydride. Anhydrous solvents were also obtained by passing them through commercially available activated alumina columns. Yields refer to chromatographically and 35 spectroscopically (<sup>1</sup>H NMR) homogeneous materials, unless otherwise stated. All solutions used in workup procedures were saturated unless otherwise noted. All reagents were purchased at highest commercial quality and used without further

-15-

purification unless otherwise stated.

All reactions were monitored by thin-layer chromatography carried out on 0.25 mm E. Merck silica gel plates (60F-254) 5 using UV light as visualizing agent and 7% ethanolic phosphomolybdic acid or *p*-anisaldehyde solution and heat as developing agents. E. Merck silica gel (60, particle size 0.040-0.063 mm) was used for flash column chromatography. Preparative thin-layer chromatography separations were carried 10 out on 0.25, 0.50 or 1 mm E. Merck silica gel plates (60F-254). Reverse phase HPLC was performed on a Waters Model 600E HPLC instrument utilizing a Vydac 218TP1022 column with detection at 254 nm using a 90:10  $\Delta$  40:60  $H_2O:CH_3CN + 0.1\%$  TFA gradient over 40 minutes.

NMR spectra were recorded on Bruker DRX-600, AMX-500, AMX-400 or AC-250 instruments and calibrated using residual undeuterated solvent as an internal reference. The following abbreviations were used to explain the multiplicities: s, 20 singlet; d, doublet; t, triplet; q, quartet; m, multiplet; band, several overlapping signals; b, broad. IR spectra were recorded on a Perkin-Elmer 1600 series FT-IR spectrometer. High resolution mass spectra (HRMS) were recorded on a VG ZAB-ZSE mass spectrometer under fast atom bombardment (FAB) 25 conditions. Electrospray mass spectra were recorded on a Perkin Elmer Science API III mass spectrometer.

**Synthesis of Amino Acid Derivative 25 as shown in Figure 5.**

Compound 25: To a solution of *t*-butoxy-carbonyl-(*L*)- 30 asparagine 24 (12.6 g, 50 mol; Aldrich) in MeOH (200 mL) was added water (20 mL). The solution was neutralized with a 20% aqueous solution of Cs<sub>2</sub>CO<sub>3</sub> (57 mL) and then evaporated to dryness. The resulting residue was taken up in DMF (50 mL) and then azeotropically dried by evaporation to dryness. The 35 cesium salt was then taken up in DMF (125 mL) followed by addition of benzyl bromide (6.5 mL, 55 mmol). The mixture was stirred at room temperature for 6 hours, evaporated to dryness

and the residue triturated with water (500 mL). The solid was dissolved in ethyl acetate (150 mL) and the organic phase was washed with water (75 mL), dried over  $\text{Na}_2\text{SO}_4$ , and the solvent was removed under reduced pressure. The crude ester was 5 recrystallized from ethyl acetate/hexane to give **25** (15.1 g, 88 %) as a colorless solid. IR (KBr):  $\nu_{\text{max}}$  3401, 3349, 3204, 2982, 2935, 1741, 1688, 1657, 1524, 1293, 1169, 1055  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR (500 MHz,  $\text{CDCl}_3$ ): d 7.36-7.32 (m, 5 hours, Ph), 5.73 (d,  $J$  = 8.5 Hz, 1 H,  $\text{NHCO}_2$ ), 5.59 (bs, 1 H, CONHH), 5.40 (bs, 1 H, 10 CONHH), 5.20 (d,  $J$  = 12.5 Hz, 1 H, CHHPh), 5.17 (d,  $J$  = 12.5 Hz, 1 H, CHHPh), 4.56 (ddd,  $J$  = 4.0, 5.0, 8.5 Hz, 1 H, CHCH<sub>2</sub>), 2.95 (dd,  $J$  = 5.0, 16.5 Hz, 1 H, CHCHH), 2.76 (dd,  $J$  = 4.0, 16.5 Hz, 1 H, CHCHH), 1.42 (s, 9 H, <sup>3</sup>Bu);  $^{13}\text{C}$  NMR (150 MHz,  $\text{CDCl}_3$ ): d 171.9, 171.2, 155.7, 135.4, 128.5, 128.3, 128.2, 15 80.1, 67.4, 50.3, 37.4, 28.3; FAB-HRMS ( $\text{M}+\text{Na}^+$ ) calcd 345.1426, found 345.1421.

**Synthesis of compound 26 as illustrated in Figure 5:** To a stirred solution of bis[trifluoroacetoxy]phenyl iodine (2.0 g, 20 4.7 mmol) in DMF:H<sub>2</sub>O (24 mL, 1:1, v/v) compound **25** (1.0 gram, 3.1 mmol) was added at room temperature. After 15 min, pyridine (0.5 mL, 6.2 mmol) was added and stirring was continued for 3 hours. The solvent was removed under reduced pressure and the residue dissolved in water (30 mL). The 25 solution was washed with ether and the aqueous layer was basified with 1 N NaOH and extracted with dichloromethane. The solvent was removed under reduced pressure to give an oily residue. Purification by flash column chromatography (10 % MeOH in  $\text{CH}_2\text{Cl}_2$ ) gave amine **26** as a yellow oil (0.37 grams, 30 41%).  $R_f$  = 0.11 (2.5% methanol in ethyl acetate); IR (thin film):  $\nu_{\text{max}}$  3366, 3313, 3064, 2979, 2934, 1688, 1518, 1501, 1456, 1393, 1368, 1324, 1254, 1204, 1166, 1055, 1002, 838, 800, 743, 692  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR (500 MHz,  $\text{CDCl}_3$ ): d 7.36-7.28 (m, 5 H, Ph), 6.36 (bm, 2 H,  $\text{NH}_2$ ), 6.06 (d,  $J$  = 7.5 Hz, 1 H,  $\text{NHCO}_2$ ), 35 5.18 (d,  $J$  = 12.0 Hz, 1 H, CHHPh), 5.13 (d,  $J$  = 12.0 Hz, 1 H, CHHPh), 4.52-4.43 (bm, 1 H, CHCH<sub>2</sub>), 3.35 (bdd,  $J$  = 12.5 Hz, 1 H, CHCHH), 3.24 (bdd,  $J$  = 6.5, 12.5 Hz, 1 H, CHCHH), 1.32 (s,

5 **Synthesis of compound 27a as illustrated in Figure 5.** To a solution of (L)-asparagine (**23**) (10.00 grams, 75.7 mmol) in H<sub>2</sub>O:dioxane (50 mL:50 mL) was added NaOH (3.40 grams, 85.0 mmol) at 0°C. After 15 min at 0°C, phenylsulfonylchloride (10.6 mL, 84.0 mmol) was added followed by addition of a  
10 solution of NaOH (3.40 grams, 85.0 mmol) in H<sub>2</sub>O (50 mL) at 0°C. After 30 min the cooling bath was removed and the solution was concentrated to ca. 50 mL under reduced pressure. The aqueous phase was extracted with ethyl acetate (2 x 50 mL). The aqueous layer was acidified at 0°C with conc. aqueous  
15 HCl (pH ≈ 1) while the protected amino acid precipitated. The resulting solid was collected by filtration and washed with H<sub>2</sub>O (20 mL). Overnight drying in an oven at ca. 50°C gave **27a** as a colorless solid (14.6 grams, 71%). The crude product was used without further purification. IR (KBr): ν<sub>max</sub> 3495, 3338,

**Synthesis of compound 55(b) wherein -NH<sub>2</sub> substituent of compound 55 is replaced with -OH.**

Step A: To a solution of 3-hydroxypropionic acid (.073  
15 g, 0.16 mmol, 1.0 equiv.) was added DMF (0.5 mL, .32 M), imidazole (26.0 mg, 0.38 mmol, 2.4 equiv.) and TBDPSCl (.046 mL, 0.19 mmol, 1.2 equiv.) and allowed to stir for 2.5 hour at 25 °C. The solution was then diluted with ether (10 mL) and then washed with a saturated solution of 5% hydrogen chloride  
20 (2X 10 mL), water (2X 10 mL), brine (1X 5 mL) and then dried over MgSO<sub>4</sub>. The compound was purified by flash column chromatography (silica, 80% ether in light petroleum ether) and carried onto the next step as follows:

Step B: To a solution of phenylenediamine (1.08 g, 0.01  
25 mol) in 5.5 N HCl (10 mL) was added the protected intermediate formed in step A (1.125g, 0.015 mol) at room temperature. The reaction mixture was refluxed for 24 h and then allowed to cool to room temperature. The solvent was removed *in vacuo* to give a precipitate, which was filtered and washed with ether;  
30 and then

Step C: The TBDPS group was removed as follows: A solution of intermediate from Step B (7.481 mmol) in THF (0.1M) was cooled to 0 °C and treated with azeotropically dried (benzene, 3 x 50 mL) TBAF (22.44 mmol). The reaction  
35 mixture was stirred at 0 °C for 10 h and quenched with saturated aqueous NH<sub>4</sub>Cl. the two layers were separated and the aqueous phase was extracted with a mixture of ethyl

-19-

acetate and ethyl ether. The combined organic phase was washed with brine, dried, and concentrated. Purification by silica gel column chromatography gave the pure compound 55(b) wherein -NH<sub>2</sub> substituent of compound 55 is replaced with -OH.

5

**Synthesis of compound 55(c) wherein -NH<sub>2</sub> substituent of compound 55 is replaced with -SH.**

To a solution of phenylenediamine (1.08 g, 0.01 mol) in 5.5 N HCl (10 mL) was added 3-mercaptopropionic acid (1.125g, 10 0.015 mol) at room temperature. The reaction mixture was refluxed for 24 h and then allowed to cool to room temperature. The solvent was removed *in vacuo* to give a precipitate, which was filtered and washed with ether to give the pure compound 55(c) wherein -NH<sub>2</sub> substituent of compound 15 55 is replaced with -SH.

**Synthesis of compound 67 (b) and (c) wherein the -NH- group is substituted by either an -S- or -O- diradical (-NH- case is 20 illustrated in Figure 9).** To a solution of 57 (0.10 g, 0.20 mmol; synthesized above) in DMF (8 mL) was added 55 (b) or (c) (0.038 g, 0.22 mmol; synthesized above) and triethylamine (0.06 mL, 0.44 mmol) at room temperature. After stirring at 25 °C for 16 h, the reaction mixture was diluted with EtOAc (10 mL) and water (10 mL). The layers were separated and the aqueous layer was extracted with ethyl acetate (2 x 10 mL). The organic extracts were collected and washed with water (2 x 10 mL) and brine (20 mL) and dried over Na<sub>2</sub>SO<sub>4</sub>. After filtration and evaporation under reduced pressure the residue 25 was purified by flash chromatography (silica, ethyl acetate) to give 67 (b) or (c).

**Synthesis of compound 20 (b) or (c) wherein the -NH group is substituted by either an -S- or -O- diradical (-NH- case is 35 illustrated in Figure 9).** To a solution of 67 (b) or (c) (0.068 g, 0.11 mmol; synthesized above) in CH<sub>2</sub>Cl<sub>2</sub> (2 mL) was added trifluoroacetic acid (2 mL) at room temperature. After

-20-

4 h, the solvent was removed in vacuo to give an oil which after RP-HPLC (C-18) gave **20 (b)** or **(c)** as a yellow solid.

5 **Synthesis of compound 28a as illustrated in Figure 5.** To a round-bottom flask equipped with a magnetic stirring bar was added an aqueous solution of NaOH (11.15 grams, 280.0 mmol) in water (50 mL) and cooled to 0°C. Bromine (2.60 mL, 50.0 mmol) was added dropwise within 5 min and the reaction mixture was  
10 stirred for further 5 min at this temperature. A solution of the protected amino acid **27a** (10.44 grams, 38.0 mmol) in a solution of NaOH (3.10 grams, 70.0 mmol, 30 mL H<sub>2</sub>O) was added in one portion at 0°C. Stirring was continued at this temperature for 20 min and upon removal of the cooling bath  
15 the reaction mixture was heated to 90°C for an additional 30 min. After cooling to 0°C the pH of the reaction mixture was adjusted to 7 with concentrated and 1 M aqueous HCl. The resulting colourless precipitate was collected by filtration. The residue was washed with water, dried overnight in an oven  
20 at ca. 50°C to give **28a** as colorless solid (6.95 grams, 75%). The crude product was used without further purification. IR (KBr):  $\nu_{max}$  3509, 3299, 3058, 2936, 1636, 1596, 1522, 1446, 1413, 1355, 1340, 1300, 1246, 1163, 1094, 1028, 924 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, DMSO-d<sup>6</sup>): δ 7.84–7.82 (m, 2 H, Ph), 7.66–7.63

Synthesis of compound **29a** as illustrated in Figure 5. A sealed tube equipped with a magnetic stirring bar was charged 15. with **28a** (4.88 grams, 20.0 mmol) and 75 mL of anhydrous dimethoxyethane. After addition of 3.0 mL of conc. H<sub>2</sub>SO<sub>4</sub>, the reaction mixture was cooled to -78°C under an atmosphere of argon and 40.0 mL of isobutylene was condensed into the sealed tube. After sealing the cooling bath was removed and the 20 reaction mixture was stirred for 48 hours at room temperature. The reaction mixture was poured into 100 mL of ice water. The aqueous solution was extracted with diethyl ether (40 mL) and then the pH of the aqueous phase adjusted to 12-13 with 6 N aqueous NaOH. The free amine was extracted with ethyl acetate 25 (4 x 50 mL) and the combined organic extracts were washed successively with saturated aqueous NaHCO<sub>3</sub>-solution (50 mL), 5 % aqueous KHSO<sub>4</sub>-solution (50 mL) and brine (50 mL). The organic phase was dried over MgSO<sub>4</sub>, filtrated and the solvent removed in vacuo to give **29a** (10.9 grams, 55.5%) as an off- 30 white solid. The crude product was used without further purification. What is claimed is:

1. An RGD mimetic represented by the following structure:

5

10 wherein R<sup>1</sup> is a radical selected from a group consisting of one of the following structures:

15

20 X is a diradical selected from a group consisting of sulfur, -NH- and oxygen; R<sup>2</sup> is a radical selected from a group consisting of -CO<sub>2</sub>t-Butyl, -CO-Aryl and -SO<sub>2</sub>-Aryl.

25

2. An RGD mimetic as described in claim 1 wherein Aryl is selected from a group consisting of phenyl, 1-naphthyl, and 2-naphthyl.

30

3. An RGD mimetic as described in claim 2 wherein R<sup>2</sup> is -SO<sub>2</sub>-Aryl.

-50-

4. An RGD mimetic as described in claim 1 represented by the following structure:

14. An RGD mimetic as described in claim 1 represented by the following structure:

30

15. An RGD mimetic as described in claim 1 represented by the following structure:

-53-

16. A method for producing an RGD mimetic represented by the following structure:

5

wherein R<sup>1</sup> is a radical selected from a group consisting of one of the following structures:

10

15

; and

X is a diradical selected from a group consisting of sulfur, -  
20 NH- and oxygen; R<sup>2</sup> is a radical selected from a group  
consisting of  
-CO<sub>2</sub>t-Butyl, -CO-Aryl and -SO<sub>2</sub>-Aryl;

the method comprising the following steps:

25

Step 1: Providing a nitroaryl precursor having a fluoride group covalently attached to the nitroaryl ring represented by the following structure:

30

wherein R<sub>3</sub> is an acid protecting group; then

35 Step 2: Displacing the fluoride group with a nucleophile having a protected guanidine group using nucleophilic aromatic substitution for producing a protected RGD mimetic; and then

-54-

Step 3: Deprotecting the protected RGD mimetic with an acid for producing the RDG mimetic.

5 17. An RGD mimetic represented by the following structure:

10 wherein R<sup>2</sup> is a radical selected from a group consisting of -CO<sub>2</sub>t-Butyl, and -SO<sub>2</sub>-Aryl.

18. An RGD mimetic as described in claim 17 wherein **Aryl** is selected from a group consisting of phenyl, 1-naphthyl, and 2-15 naphthyl.

19. A process for differentially inhibiting  $\alpha_{iib}\beta_3$  mediated cell adhesion over  $\alpha_v\beta_3$  mediated cell adhesion comprising the following step:

20

contacting  $\alpha_{iib}\beta_3$  expressing cells with a solution containing an RGD mimetic selected from the compounds of claims 5, 7, 9, 11, 14, or 15, said solution having a concentration of the RGD mimetic sufficient for inhibiting 25  $\alpha_{iib}\beta_3$  mediated cell adhesion,

wherein  $\alpha_{iib}\beta_3$  mediated cell adhesion is inhibited at least approximately 100 fold more than  $\alpha_v\beta_3$  mediated cell adhesion.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US99/15252

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) : A61K 31/435; C07D 487/04

US CL : 514/300; 544/336, 358

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 514/300; 544/336, 358

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 5,741,796 A (HARTMAN et al) 21 April, col. 2-6,	1,2,3 in part, 5-7,9, 10,12,13,15,16 in part and 19
Y	STEWART et al., Reaction Mechanisms Displayed by Catalytic Antibodies, Accounts Chem Res., 1993. Vol 26. pages 396-398.	1,2 and 3 in part 5-7,9, 10,12,13,15,16 in part and 19

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:	"T"	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	"X"	document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*B* earlier document published on or after the international filing date	"Y"	document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"A"	document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means		
*P* document published prior to the international filing date but later than the priority date claimed

**INTERNATIONAL SEARCH REPORT**

International application No.  
PCT/US99/15252

**BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING**  
This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, claim(s) 1,2 and 3(in part),5-7,9,10,12,13,15, 16(in part),19 drawn to R1 being non-cyclic amine, corresponding method of preparation and use.

Group II, claim(s)1(in part),11,14 and 16 drawn to R1 being piperazine.

Group III, claim(s)1 (in part),4,8,16-18 , drawn to R1 being monocyclic imidazole and bicyclic ring wherein imidazole is fused to benzene ring.

The inventions listed as Groups I-III do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The groups as outlined above are not so linked as to form a single inventive concept as they are drawn to structurally dissimilar compounds of varying cores and functional moieties.

**INTERNATIONAL SEARCH REPORT**

International application No.

PCT/US99/15252

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 1,2, and 3(in part), 5-7, 9, 10, 12, 13, 15, 16(in part), 19 drawn to R1 being non-cyclic amino, corresponding method of preparation and use

Remark on Protest

The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
